1 Transport Layer

1.1

Transport layer **application process** (logical communication) .

Network layer	host	host
Transport layer	process	process

- : App segment → Network layer
- : Segment → App layer

i : Household Analogy

Ann 12 Bill 12 :

- Houses = **hosts**
- Kids = **processes**
- Letters = **app messages**
- Ann/Bill () = **transport protocol (demux)**
- = **network-layer protocol**

1.2 Internet Transport Protocol

	TCP	UDP
	Connection-oriented	Connectionless
	Flow control	
	Congestion control	
Header	20 bytes	8 bytes
	HTTP, FTP, SMTP	DNS, streaming, SNMP

2 Multiplexing & Demultiplexing

2.1

- **Multiplexing** (): transport header network layer
- **Demultiplexing** (): header segment

2.2 UDP (Connectionless) Demux

- **2-tuple:** (dest IP, dest port)
- (src IP, src port) dest port →

2.3 TCP (Connection-oriented) Demux

- **4-tuple:** (src IP, src port, dest IP, dest port)
- dest port 80 src demux

TCP 4-tuple , (80) .

3 UDP (User Datagram Protocol)

3.1 Segment

source port #	dest port #	16 + 16 bits
length	checksum	16 + 16 bits
application data		

- **length:** UDP segment (header + data)

3.2 UDP

- No connection establishment →
- No connection state →
- Small header (8 bytes vs TCP 20 bytes)
- No congestion control →

3.3 UDP Checksum

3.3.1

“segment ” , Pseudo Header + UDP Header + UDP Data .

Pseudo Header (IP header):

Source IP Address (32 bits)

Destination IP Address (32 bits)

zero (8b) Protocol=17 (8b)

UDP Length (16 bits)

i Pseudo Header ?

UDP header IP . Pseudo header **IP** (wrong delivery) .

3.3.2 1 (One's Complement)

1 :

0110 1010 → 1001 0101 (1)

$$: x + \sim x = \underbrace{1111 \dots 1}_{\text{all ones}}$$

3.3.3 (16-bit)

1111 0011 0011 0011 0 ← (17 , carry)
+ 1110 1010 1010 1010 1

1101 1101 1101 1101 1 ← carry out
+ 1 ← wrap around (carry)

1101 1101 1101 1110 0 ← sum

Checksum = 1 :

0010 0010 0010 0001 1 ← checksum

3.3.4

: 16-bit word + checksum

$$\text{sum} + \text{checksum} = \underbrace{1111 \dots 1}_{\text{all ones}} \Rightarrow$$

$$\text{sum} + \text{checksum} \neq \underbrace{1111 \dots 1}_{\text{all ones}} \Rightarrow$$

. (best-effort)

4 Principles of Reliable Data Transfer (rdt)

4.1

rdt 1.0	-	(trivial)
rdt 2.0	checksum, ACK/NAK	
rdt 2.1	Sequence number (0,1)	ACK/NAK
rdt 2.2	NAK , duplicate ACK	NAK-free
rdt 3.0	Countdown timer	

4.2 rdt 2.0 —

ACK/NAK sender .

- → duplicate
- → **Sequence number** (rdt 2.1)

4.3 rdt 3.0 — Stop-and-Wait

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R}$$

: 1 Gbps link, RTT = 30ms, L = 8000 bits

$$U_{\text{sender}} = \frac{0.008}{30.008} \approx 0.00027 \quad (0.027\%!)$$

→

4.3.1 rdt 3.0 4

(a)	-	
(b) Packet loss		timeout →
(c) ACK loss	ACK	timeout → , receiver duplicate re-ACK
(d) Premature timeout	ACK	seq# duplicate

5 Pipelined Protocols

5.1

3 :

$$U_{sender} = \frac{3 \cdot L/R}{RTT + L/R}$$

→ 3

5.2 Go-Back-N (GBN) vs Selective Repeat (SR)

	GBN	SR
Sender window	N in-flight	N in-flight
Receiver window	1	N
ACK	Cumulative ACK	ACK
Out-of-order	Discard () window unacked pkt	Buffer pkt
Timer	oldest unacked pkt	pkt

6 Window Size —

6.1

window size :

$$W_{sender} + W_{receiver} \leq \text{Seq\# space (N)}$$

Sender seq# Receiver “ ” seq# .

6.2 GBN

GBN receiver window = 1 :

$$W + 1 \leq N \implies W \leq N - 1 = 2^k - 1$$

- k : seq# , $N = 2^k$: seq#

6.3 SR

SR receiver window = sender window = **W** :

$$W + W \leq N \implies W \leq \frac{N}{2}$$

!

GBN ($W \leq 2^k - 1$) SR ($W \leq 2^k/2$) . GBN receiver window 1 .
() , receiver window sender window .

6.4 SR Dilemma — N/2 ?

6.4.1 Seq#

Seq# (circular) . (N=4: 0,1,2,3)

W = 3 ($> N/2 = 2$) $\rightarrow$

Step 1: Sender [0,1,2] $\rightarrow$ pkt 0,1,2

Step 2: ACK 0,1,2

Receiver window : [3,0,1] $\leftarrow$

Step 3: Sender timeout $\rightarrow$ pkt 0

: seq# 0 receiver window [3,0,1] !
Receiver: " "

Receiver window = [3, 0, 1] ← 0 (!)
 Sender window = [0, 1, 2]

$W = 2 (= N/2) \rightarrow$

Step 1: Sender [0,1] → pkt 0,1
 Step 2: ACK 0,1
 Receiver window : [2,3] ←
 Step 3: Sender timeout → pkt 0

: seq# 0 receiver window [2,3] !
 Receiver: "old data → "

Receiver window = [2, 3] ← 0 (!)
 Sender window = [0, 1]

6.4.2

window N .

$$2W > N \Rightarrow > \Rightarrow$$

$$2W \leq N \Rightarrow \text{non-overlapping}$$

7 TCP

7.1 Segment

source port dest port 16 + 16 bits

sequence number	32 bits	
acknowledgement number	32 bits	
hlen	flags	receive window
checksum	urg	data pointer
options (variable)		
application data		

: URG, ACK, PSH, RST, SYN, FIN

7.2 TCP Sequence Number & ACK

7.2.1 TCP “byte stream”

TCP .

- **Seq#**: segment
- **ACK#**: (= + 1)
- **Cumulative ACK**: “ ”

7.2.2 Telnet (p.54)

: A seq# = 42, B seq# = 79

A [Seq=42, ACK=79, data='C'] B

Seq=42: " 42 "
 ACK=79: "B 79 "
 data='C': 1

A [Seq=79, ACK=43, data='C'] B

Seq=79: " 79 "
 ACK=43: "A 42 (1)
 → 43 "

A [Seq=43, ACK=80] B

ACK=80: "B 79 (1)
 → 80 "

💡 ACK = Seq + data

ACK# "X " = "X-1 " . Seq=42, 1 → ACK=43 (42+1).

7.3 RTT

7.3.1 EWMA (Exponentially Weighted Moving Average)

$$\text{EstimatedRTT} = (1 - \alpha) \cdot \text{EstimatedRTT} + \alpha \cdot \text{SampleRTT}$$

$$\alpha = 0.125 \text{ (typical)}$$

→ .

7.3.2 (DevRTT)

$$\text{DevRTT} = (1 - \beta) \cdot \text{DevRTT} + \beta \cdot |\text{SampleRTT} - \text{EstimatedRTT}|$$

$$\beta = 0.25 \text{ (typical)}$$

7.3.3 Timeout Interval

$$\text{TimeoutInterval} = \text{EstimatedRTT} + 4 \cdot \text{DevRTT}$$

i

mean + 4σ , 99.99% . safety margin .

7.3.4 Retransmission RTT ?

Ambiguity (Karn's Algorithm):

t=0: pkt (seq=100)

t=5: timeout →

t=8: ACK(100)

SampleRTT = ?

 : 8 - 0 = 8ms ()

 : 8 - 5 = 3ms ()

→ ACK !

RTT : - → Timeout → - → Timeout →

7.4 TCP Reliable Data Transfer

7.4.1

1. **Timeout:** unacked segment
2. **3x Duplicate ACK:** Fast Retransmit

7.4.2 ACK (RFC 1122, 2581)

segment, pending ACK	500ms ACK (Delayed ACK)
segment, pending ACK	cumulative ACK
Out-of-order segment (Gap)	duplicate ACK
Gap segment	ACK

7.4.3 Cumulative ACK (p.62)

Host A

Host B

Seq=92 (8 bytes)

Seq=100 (20 bytes)

← ACK=100

(B 92, 100 buffer)

timeout !

Seq=92

ACK=120

ACK=120 ? B Seq=92(8 bytes) Seq=100(20 bytes) buffer : - 92~99 (8 bytes) +
100~119 (20 bytes) = **119** - → ACK=120: “120 (119)”

Cumulative ACK : ACK=100 , ACK=120 100~119 .

7.4.4 Fast Retransmit

3 duplicate ACK → timeout

A [Seq=92] B
A [Seq=100] X ()
A [Seq=120] B
A [Seq=140] B

B ACK=100 (dup)

B ACK=100 (dup)

B ACK=100 (dup) ← 3 !

A: timeout Seq=100

7.5 TCP Flow Control

7.5.1

buffer overflow (cf. Congestion control)

7.5.2

$$rwnd = RcvBuffer - [LastByteRcvd - LastByteRead]$$

- **RcvBuffer:** (4096 bytes)
- **LastByteRcvd:**
- **LastByteRead:** Application

Receiver TCP segment header **rwnd** .

Sender :

$$LastByteSent - LastByteAcked \leq rwnd$$

7.5.3 rwnd = 0

Receiver rwnd=0 sender . buffer sender (trigger).

: sender **1 byte probe segment** . Receiver ACK rwnd .

7.5.4 Flow Control vs Congestion Control

Flow Control	Congestion Control
buffer	
rwnd (receiver → sender)	packet loss, delay
rwnd sender	cwnd sender
min(rwnd, cwnd)	

7.6 TCP Connection Management

7.6.1 3-way Handshake

Client	Server
[SYN, Seq=x]	
[SYNACK, Seq=y, ACK=x+1]	
[ACK, ACK=y+1]	

Client state: CLOSED → SYN_SENT → ESTAB

Server state: LISTEN → SYN_RCVD → ESTAB

2-way handshake : , , half-open connection .

7.6.2 Connection Teardown

Client	Server
[FIN]	Client: FIN_WAIT_1 → FIN_WAIT_2
[ACK]	Server: CLOSE_WAIT
[FIN]	Server: LAST_ACK
[ACK]	Client: TIMED_WAIT (2×MSL) → CLOSED
	Server: CLOSED

TIMED_WAIT: $2 \times \text{MSL}$ (Maximum Segment Lifetime) . duplicate segment .

8 Principles of Congestion Control

8.1 (Congestion) ?

“ source ”

Flow control : - Flow control: buffer - Congestion control:

8.2 (3)

8.2.1 Scenario 2 : Goodput vs Throughput

Perfect knowledge ():

$\text{lin}' = R/2$:
 $= \quad + (\quad)$
 $\text{drop} =$
 $\rightarrow \quad R/2$
 $\text{goodput} \quad R/2$ (asymptotic)

💡 p.83

“sending at $R/2$ goodput $R/2$?”
 $(\quad)$. $R/2$.
premature timeout bandwidth goodput $< R/2$.

Realistic (timeout):

$$\text{goodput} < \frac{R}{2}$$

8.2.2 Scenario 3: Upstream

drop , capacity .

9 TCP Congestion Control

9.1 AIMD (Additive Increase Multiplicative Decrease)

- **Additive Increase:** loss RTT cwnd += 1 MSS
- **Multiplicative Decrease:** loss cwnd = cwnd / 2

$$\text{sending rate} \approx \frac{\text{cwnd}}{\text{RTT}} \text{ bytes/sec}$$

9.2 Slow Start

- cwnd = 1 MSS
- RTT 2 (ACK +1 MSS →)
- ssthresh linear(CA)

cwnd

$\leftarrow \text{ssthresh}$

(linear)

()

time

(Slow Start)

9.3 TCP Tahoe vs TCP Reno

9.3.1

loss ?

Timeout	3 Dup ACK
	, 3 →

9.3.2 TCP Tahoe (1988)

loss :

Timeout : cwnd = 1 MSS, ssthresh = cwnd_before/2, Slow Start

3 Dup ACK : cwnd = 1 MSS, ssthresh = cwnd_before/2, Slow Start

9.3.3 TCP Reno (1990)

3 Dup ACK **Fast Recovery** :

Timeout :

→ cwnd = 1 MSS

→ ssthresh = cwnd / 2

→ Slow Start (Tahoe)

3 Dup ACK (Fast Recovery):

→ ssthresh = cwnd / 2

→ cwnd = ssthresh + 3 MSS $\leftarrow$ 3 dup ACK = 3 pkt

→ segment

→ dup ACK : cwnd += 1 MSS (window inflation)

→ New ACK : cwnd = ssthresh, CA

i Window Inflation

Fast Recovery :
 dup ACK dup ACK 1 sender 1

9.3.4 cwnd

cwnd

Tahoe: loss → (1 MSS)

Reno: 3dup → ssthresh ,

9.3.5 TCP

Tahoe	1988	congestion control, loss = cwnd=1
Reno	1990	Fast Recovery (3 dup ACK)
NewReno	1999	Reno partial ACK
CUBIC	2008	Linux , cubic cwnd
BBR	2016	bandwidth & RTT (Google)

9.4 TCP Throughput

Window size W :

$$\text{avg throughput} = \frac{3}{4} \cdot \frac{W}{\text{RTT}}$$

Loss L (Mathis 1997):

$$\text{TCP throughput} = \frac{1.22 \cdot \text{MSS}}{\text{RTT} \cdot \sqrt{L}}$$

: MSS=1500B, RTT=100ms, 10 Gbps:

$$L \leq 2 \times 10^{-10} \quad (\text{loss rate})$$

9.5 TCP Fairness

K TCP bandwidth $R \rightarrow R/K$

AIMD : throughput “equal bandwidth” zigzag (additive increase = 1 , multiplicative decrease =)

9.6 ECN (Explicit Congestion Notification)

- IP ToS field 2
- TCP ACK **ECE bit** $\rightarrow$
-

10

! TCP

TCP Tahoe/Reno **loss = congestion** .
 : - $\rightarrow$ (!) - $\rightarrow$ - (fading) $\rightarrow$ loss
 TCP congestion $\rightarrow$ cwnd $\rightarrow$
 BBR, CUBIC, TCP (: TCP-Westwood, TCP-Veno) .

11

$U_{sender} = \frac{L/R}{RTT+L/R}$	Stop-and-wait sender utilization
$W_{GBN} \leq 2^k - 1$	GBN window size
$W_{SR} \leq \frac{2^k}{2}$	SR window size
$EstRTT = (1 - \alpha)EstRTT + \alpha \cdot SampleRTT$	EWMA RTT ($\alpha = 0.125$)
$DevRTT =$	RTT ($\beta = 0.25$)
$(1 - \beta)DevRTT + \beta \cdot \ SampleRTT - EstRTT\ $	
$TimeoutInterval = EstRTT + 4 \cdot DevRTT$	TCP timeout interval
$rwnd =$	Flow control
$RcvBuffer - [LastByteRcvd - LastByteRead]$	
$avg\ throughput = \frac{3W}{4 \cdot RTT}$	TCP
$TCP\ throughput = \frac{1.22 \cdot MSS}{RTT \sqrt{L}}$	Loss (Mathis)
